Anatomy and physiology reference

Marieb, E. N. Human Anatomy & Physiology (Pearson, lecture edition, Chapter 8: The Nervous System). Cranial nerve nuclear locations in the medulla oblongata and pons; nucleus ambiguus as the shared motor nucleus for cranial nerves IX and X; ascending spinothalamic pathway crossing level.

Documented clinical case

"Wallenberg Syndrome After Leg Day Training: A Case Report." PMC, 2026. PMC12634019. A previously healthy 40-year-old male developed right lateral medullary syndrome following a high-intensity resistance training session, with confirmed vertebral artery occlusion (V3 segment) on CT angiography and acute infarct of the right lateral medulla on MRI.

Illustration 1: Lateral medullary cross-section

Unreal Engine 5 photoreal cutaway render, built to the locked activemillers rendering standard (pure black background, no diagrammatic overlays, structures identifiable by real anatomical appearance and position). Depicts ischemic territory confined to the lateral medulla against healthy medial tissue.

Illustration 2: Pyramidal decussation

Unreal Engine 5 photoreal render of the corticospinal tract crossing at the pyramidal decussation, showing the majority-crossed lateral corticospinal tract and minority-uncrossed anterior corticospinal tract, both terminating in spinal cord white matter only.
